1. Introduction

Albert Bandura recently stated that 'the advent of the Internet ushered in a ubiquitous vehicle for disengaging moral self-sanctions from transgressive conduct. The Internet was designed as a highly decentralized system that defies regulation. Anybody can get into the act, and nobody is in charge' (2016, p.68). Rather than demonising the web, Bandura claims that we need to better understand the social-cognitive processes that deactivate moral agency, namely Moral Disengagement (MD), during online interactions. To this end, within Bandura's theoretical framework (1991, 2016), this study examined the role of MD (traditional and online) in relation to one of the most discussed 'millennials' online deviant behaviours: **cyberbullying**. Indeed, data from surveys conducted in industrialised countries suggest a prevalence rate for cyberbullying ranging from 5% to 21% (UNESCO, 2017). Worryingly, cyberbullying is increasing also in Europe, with the exposure to cyberbullying increasing from 7 to 12% between 2010 and 2014 among adolescents (UNESCO, 2018). Moreover, recent meta-analyses reported prevalence rates for cyberbullying victimisation among school aged children as ranging from 10 to 40% across studies (Kowalski et al., 2014, Kowalski
